

LNx8 Handle Adjustment Instructions

The LNx8 machine may be ordered with optional adjustable handlebars. The handlebars are equipped with a high-density vibration suppression material to minimize operator fatigue and increase comfort level when operating equipment.

To adjust the handlebars to a new position for different height operators please follow these steps:

Using a box wrench or socket, loosen the bolts on both sides of the handlebars two to three turns only.

Use a hammer to lightly tap the end of the bolts to move them in slightly. (Tapping loosens the tapered inner plug so they may be easily re-positioned)

Stand behind the machine and set the bars to a comfortable operating height.

Re-tighten the two bolts to lock the handlebars in the new position.

CAUTION: Never operate with handlebars loose. The bolts must be fastened tightly assuring the handle is locked into position.
